TRANSMITTAL LETTER TO THE UNITED STATES  
DESIGNATED/ELECTED OFFICE (DO/EO/US)  
CONCERNING A FILING UNDER 35 U.S.C. 371

U.S. APPLICATION NO. (if known, see 37 C.F.R. 1.5)

097857691

INTERNATIONAL APPLICATION NO.

PCT/GB99/04129

INTERNATIONAL FILING DATE

December 9, 1999

PRIORITY DATE CLAIMED

December 10, 1998

TITLE OF INVENTION

## USE OF HUMAN PROSTATE CELL LINES IN CANCER TREATMENT

APPLICANT(S) FOR DO/EO/US

Angus George DALGLEISH; Peter Michael SMITH; Andrew Derek SUTTON; Anthony Ian WALKER

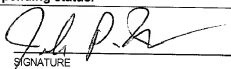

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:

1. ☒ This is a FIRST submission of items concerning a filing under 35 U.S.C. 371.
2. ☐ This is a SECOND or SUBSEQUENT submission of items concerning a filing under 35 U.S.C. 371.
3. ☐ This express request to begin national examination procedures (35 U.S.C. 371(f)) at any time rather than delay examination until the expiration of the applicable time limit set in 35 U.S.C. 371(b) and PCT Articles 22 and 39(1).
4. ☒ A proper Demand for International Preliminary Examination was made by the 19<sup>th</sup> month from the earliest claimed priority date.
5. ☒ A copy of the International Application as filed (35 U.S.C. 371©(2))
  - a. ☐ is transmitted herewith (required only if not transmitted by the International Bureau).
  - b. ☒ has been transmitted by the International Bureau.
  - c. ☐ is not required, as the application was filed in the United States Receiving Office (RO/US)
6. ☐ A translation of the International Application into English (35 U.S.C. 371 ©(2)).
7. ☒ Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371©(3))
  - a. ☐ are transmitted herewith (required only if not transmitted by the International Bureau).
  - b. ☐ have been transmitted by the International Bureau.
  - c. ☐ have not been made; however, the time limit for making such amendments has NOT expired.
  - d. ☒ have not been made and will not be made.
8. ☐ A translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371©(3)).
9. ☐ An oath or declaration of the inventor(s) (35 U.S.C. 371©(4)).
10. ☐ A translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371©(5)).

## Items 11. to 16. below concern other document(s) or information included:

11. ☐ An Information Disclosure Statement under 37 CFR 1.97 and 1.98.
12. ☐ An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.
13. ☒ A FIRST preliminary amendment.  
☐ A SECOND or SUBSEQUENT preliminary amendment.
14. ☐ A substitute specification.
15. ☐ A change of power of attorney and/or address letter.
16. ☒ Other items or information:

(1) Copy of International Preliminary Examination Report (Form PCT/IPEA/409) and Annexes

## New Cancer Treatments

### Field of the Invention

This invention is concerned with agents for the treatment of primary, metastatic and residual cancer in mammals (including humans) by inducing the immune system of the mammal or human afflicted with cancer to mount an attack against the tumour lesion. In particular, the invention pertains to the use of whole-cells, derivatives and portions thereof with or without vaccine adjuvants and/or other accessory factors. More particularly, this disclosure describes the use of particular combinations of whole-cells and derivatives and portions thereof that form the basis of treatment strategy.

### Background to the Invention

It is known in the field that cancerous cells contain numerous mutations, qualitative and quantitative, spatial and temporal, relative to their normal, non-cancerous counterparts and that at certain periods during tumour cells' growth and spread a proportion of these are capable of being recognised by the hosts' immune system as abnormal. This has led to numerous research efforts world-wide to develop immunotherapies that harness the power of the hosts' immune system and direct it to attack the cancerous cells, thereby eliminating such aberrant cells at least to a level that is not life-threatening (reviewed in Maraveyas, A. & Dalgleish, A.G. 1977 *Active immunotherapy for solid tumours in vaccine design* in The Role of Cytokine Networks, Ed. Gregoriadis *et al.*, Plenum Press, New York, pages 129-145; Morton, D.L. and Ravindranath, M.H. 1996 *Current concepts concerning melanoma vaccines* in Tumor Immunology – Immunotherapy and Cancer Vaccines, ed. Dalgleish, A.G. and Browning, M., Cambridge University Press, pages 241-268. See also other papers in these publications for further detail).

Numerous approaches have been taken in the quest for cancer immunotherapies, and these can be classified under five categories:

#### *Non-specific immunotherapy*

Efforts to stimulate the immune system non-specifically date back over a century to the pioneering work of William Coley (Coley, W.B., 1894 Treatment of inoperable malignant tumours with toxins of erisipelas and the Bacillus prodigiosus. Trans. Am. Surg. Assoc. 12: 183). Although successful in a limited number of cases (e.g. BCG for the treatment of urinary bladder cancer, IL-2 for the treatment of melanoma and renal cancer) it is widely acknowledged that non-specific immunomodulation is unlikely to prove sufficient to treat the majority of cancers. Whilst non-specific immune-stimulants may lead to a general enhanced state of immune responsiveness, they lack the targeting capability and also subtlety to deal with tumour lesions which have many mechanisms and plasticity to evade, resist and subvert immune-surveillance.

#### *Antibodies and monoclonal antibodies*

Passive immunotherapy in the form of antibodies, and particularly monoclonal antibodies, has been the subject of considerable research and development as anti-cancer agents. Originally hailed as the magic bullet because of their exquisite specificity, monoclonal antibodies have failed to live up to their expectation in the field of cancer immunotherapy for a number of reasons including immune responses to the antibodies themselves (thereby abrogating their activity) and

inability of the antibody to access the lesion through the blood vessels. To date, three products have been registered as pharmaceuticals for human use, namely *Panorex* (Glaxo-Wellcome), *Rituxan* (IDEC/Genentech/Hoffman la Roche) and *Herceptin* (Genentech/Hoffman la Roche) with over 50 other projects in the research and development pipeline. Antibodies may also be employed in active immunotherapy utilising anti-idiotypic antibodies which appear to mimic (in an immunological sense) cancer antigens. Although elegant in concept, the utility of antibody-based approaches may ultimately prove limited by the phenomenon of 'immunological escape' where a subset of cancer cells in a mammalian or human subject mutates and loses the antigen recognised by the particular antibody and thereby can lead to the outgrowth of a population of cancer cells that are no longer treatable with that antibody.

#### *Subunit vaccines*

Drawing on the experience in vaccines for infectious diseases and other fields, many researchers have sought to identify antigens that are exclusively or preferentially associated with cancer cells, namely tumour specific antigens (TSA) or tumour associated antigens (TAA), and to use such antigens or fractions thereof as the basis for specific active immunotherapy.

There are numerous ways to identify proteins or peptides derived therefrom which fall into the category of TAA or TSA. For example, it is possible to utilise differential display techniques whereby RNA expression is compared between tumour tissue and adjacent normal tissue to identify RNAs which are exclusively or preferentially expressed in the lesion. Sequencing of the RNA has identified several TAA and TSA which are expressed in that specific tissue at that specific time, but therein lies the potential deficiency of the approach in that identification of the TAA or TSA represents only a "snapshot" of the lesion at any given time which may not provide an adequate reflection of the antigenic profile in the lesion over time. Similarly a combination of cytotoxic T lymphocyte (CTL) cloning and expression-cloning of cDNA from tumour tissue has lead to identification of many TAA and TSA, particularly in melanoma. The approach suffers from the same inherent weakness as differential display techniques in that identification of only one TAA or TSA may not provide an appropriate representation of a clinically relevant antigenic profile.

Over fifty such subunit vaccine approaches are in development for the treatment of a wide range of cancers, although none has yet received marketing authorisation for use as a human pharmaceutical product. In a similar manner to that described for antibody-based approaches above, subunit vaccines may also be limited by the phenomenon of immunological escape.

#### *Gene therapy*

The majority of gene therapy trials in human subjects have been in the area of cancer treatment, and of these a substantial proportion have been designed to trigger and/or amplify patients' immune responses. Of particular note in commercial development are Allovectin-7 and Leuvectin, being developed by Vical Inc for a range of human tumours, CN706 being developed by Calydon Inc for the treatment of prostate cancer, and StressGen Inc.'s stress protein gene therapy for melanoma and lung cancer. At the present time, it is too early to judge whether these and the many other 'immuno-gene therapies' in development by commercial and academic bodies will ultimately prove successful, but it is widely accepted that commercial utility of these approaches are likely to be more than a decade away.

### Cell-based vaccines

Tumours have the remarkable ability to counteract the immune system in a variety of ways including: downregulation of the expression of potential target proteins; mutation of potential target proteins; downregulation of surface expression of receptors and other proteins; downregulation of MHC class I and II expression thereby disallowing direct presentation of TAA or TSA peptides; downregulation of co-stimulatory molecules leading to incomplete stimulation of T-cells leading to anergy; shedding of selective, non representative membrane portions to act as decoy to the immune system; shedding of selective membrane portions to anergise the immune system; secretion of inhibitory molecules; induction of T-cell death; and many other ways. What is clear is that the immunological heterogeneity and plasticity of tumours in the body will have to be matched to a degree by immunotherapeutic strategies which similarly embody heterogeneity. The use of whole cancer cells, or crude derivatives thereof, as cancer immunotherapies can be viewed as analogous to the use of whole inactivated or attenuated viruses as vaccines against viral disease. The potential advantages are:

- (a) whole cells contain a broad range of antigens, providing an antigenic profile of sufficient heterogeneity to match that of the lesions as described above;
- (b) being multivalent (i.e. containing multiple antigens), the risk of immunological escape is reduced (the probability of cancer cells 'losing' all of these antigens is remote); and
- (c) cell-based vaccines include TSAs and TAAs that have yet to be identified as such; it is possible if not likely that currently unidentified antigens may be clinically more relevant than the relatively small number of TSAs/TAAs that are known.

Cell-based vaccines fall into two categories. The first, based on autologous cells, involves the removal of a biopsy from a patient, cultivating tumour cells *in vitro*, modifying the cells through transfection and/or other means, irradiating the cells to render them replication-incompetent and then injecting the cells back into the same patient as a vaccine. Although this approach enjoyed considerable attention over the past decade, it has been increasingly apparent that this individually-tailored therapy is inherently impractical for several reasons. The approach is time consuming (often the lead time for producing clinical doses of vaccine exceeds the patients' life expectancy), expensive and, as a 'bespoke' product, it is not possible to specify a standardised product (only the procedure, not the product, can be standardised and hence optimised and quality controlled). Furthermore, the tumour biopsy used to prepare the autologous vaccine will have certain growth characteristics, interactions and communication with surrounding tissue that makes it somewhat unique. This alludes to a potentially significant disadvantage to the use of autologous cells for immunotherapy: a biopsy which provides the initial cells represents an immunological snapshot of the tumour, in that environment, at that point in time, and this may be inadequate as an immunological representation over time for the purpose of a vaccine with sustained activity that can be given over the entire course of the disease.

The second type of cell-based vaccine and the subject of the current invention describes the use of allogeneic cells which are genetically (and hence immunologically) mismatched to the patients. Allogeneic cells benefit from the same advantages of multivalency as autologous cells. In addition, as allogeneic cell

vaccines can be based on immortalised cell lines which can be cultivated indefinitely *in vitro*, thus this approach does not suffer the lead-time and cost disadvantages of autologous approaches. Similarly the allogeneic approach offers the opportunity to use combinations of cells types which may match the disease profile of an individual in terms of stage of the disease, the location of the lesion and potential resistance to other therapies.

There are numerous published reports of the utility of cell-based cancer vaccines (see, for example, Dranoff, G. *et al.* WO 93/06867; Gansbacher, P. WO 94/18995; Jaffee, E.M. *et al.* WO 97/24132; Mitchell, M.S. WO 90/03183; Morton, D.M. *et al.* WO 91/06866). These studies encompass a range of variations from the base procedure of using cancer cells as an immunotherapy antigen, to transfecting the cells to produce GM-CSF, IL-2, interferons or other immunologically-active molecules and the use of 'suicide' genes. Groups have used allogeneic cell lines that are HLA-matched or partially-matched to the patients' haplotype and also allogeneic cell lines that are mismatched to the patients' haplotype in the field of melanoma and also mismatched allogeneic prostate cell lines transfected with GM-CSF.

### Description of the Invention

The invention disclosed here relates to a product comprised of a cell line or lines intended for use as an allogeneic immunotherapy agent for the treatment of cancer in mammals and humans.

All of the studies of cell-based cancer vaccines to date have one feature in common, namely the intention to use cells that contain at least some TSAs and/or TAAs that are shared with the antigens present in patients' tumour. In each case, tumour cells are utilised as the starting point on the premise that only tumour cells will contain TSAs or TAAs of relevance, and the tissue origins of the cells are matched to the tumour site in patients.

A primary aspect of the invention is the use of immortalised normal, non-malignant cells as the basis of an allogeneic cell cancer vaccine. Normal cells do not possess TSAs or relevant concentrations of TAAs and hence it is surprising that normal cells as described herein are effective as anti-cancer vaccines. The approach is general and can be adapted to any mammalian tumour by the use of immortalised normal cells derived from the same particular tissue as the tumour intended to be treated. Immortalised normal cells can be prepared by those skilled in the art using published methodologies, or they can be sourced from cell banks such as ATCC or ECACC, or they are available from several research groups in the field.

For prostate cancer, for example, a vaccine may be based on one or a combination of different immortalised normal cell lines derived from the prostate which can be prepared using methods reviewed and cited in Rhim, J.S. and Kung, H-F., 1997 Critical Reviews in Oncogenesis 8(4):305-328 or selected from PNT1A (ECACC Ref No: 95012614), PNT2 (ECACC Ref No: 95012613) or PZ-HPV-7 (ATCC Number: CRL-2221).

A further aspect of the invention is the addition of TSAs and/or TAAs by combining one or more immortalised normal cell line(s) with one, two or three different cell lines

derived from primary or metastatic cancer biopsies.

All the appropriate cell lines will show good growth in large scale cell culture and sufficient characterisation to allow for quality control and reproducible production.

The cell lines are lethally irradiated utilising gamma irradiation at 50-300 Gy to ensure that they are replication incompetent prior to use in the mammal or human.

The cell lines and combinations referenced above, to be useful as immunotherapy agents must be frozen to allow transportation and storage, therefore a further aspect of the invention is any combination of cells referenced above formulated with a cryoprotectant solution. Suitable cryoprotectant solutions may include but are not limited to, 10-30% v/v aqueous glycerol solution, 5-20% v/v dimethyl sulphoxide or 5-20% w/v human serum albumin may be used either as single cryoprotectants or in combination.

A further embodiment of the invention is the use of the cell line combinations with non-specific immune stimulants such as BCG or M. Vaccae, Tetanus toxoid, Diphtheria toxoid, Bordetella Pertussis, interleukin 2, interleukin 12, interleukin 4, interleukin 7, Complete Freund's Adjuvant, Incomplete Freund's Adjuvant or other non-specific agents known in the art. The advantage is that the general immune stimulants create a generally enhanced immune status whilst the combinations of cell lines, both add to the immune enhancement through their haplotype mismatch and target the immune response to a plethora of TAA and TSA as a result of the heterogeneity of their specific origins.

The invention will now be described with reference to the following examples, and the Figures in which:

Figure 1 shows T-cell proliferation data for patients 112, 307, and 406;

Figure 2 shows Western Blot analysis of serum from patients 115, 304 and 402;

Figure 3 shows antibody titres of serum from patients 112, 305 and 402;

Figure 4 shows PSA data for patients 110, 303 and 404; and

Figure 5 shows survival curves for C57 mice immunised with normal melanocytes.

#### Example 1

##### *Growth, irradiation, formulation and storage of cells*

An immortalised cell line derived from normal prostate tissue namely PNT2 was grown in roller bottle culture in RPMI 1640 medium supplemented with 2 mM L-glutamine and 5% foetal calf serum (FCS) following recovery from liquid nitrogen stocks. Following expansion in T175 static flasks the cells were seeded into roller bottles with a growth surface area of 850 cm<sup>2</sup> at 1-20 x10<sup>7</sup> cells per roller bottle

An immortalised cell line derived from primary prostate tissue namely NIH1542-CP3TX was grown in roller bottle culture in KSM media supplemented with 25 µg/ml bovine pituitary extract, 5 ng/ml of epidermal growth factor, 2 mM L-glutamine, 10 mM HEPES buffer and 5% foetal calf serum (FCS) (hereinafter called "modified

KSFM™) following recovery from liquid nitrogen stocks. Following expansion in T175 static flasks the cells were seeded into roller bottles with a growth surface area of 1,700 cm<sup>2</sup> at 2-5 x 10<sup>7</sup> cells per roller bottle

Two secondary derived cell lines were also used, namely LnCap and Du145 both of which were sourced from ATCC. LnCap was grown in large surface area static flasks in RPMI media supplemented with 10% FCS and 2 mM L-glutamine following seeding at 1-10x10<sup>6</sup> cells per vessel and then grown to near confluence. Du-145 was expanded from frozen stocks in static flasks and then seeded into 850 cm<sup>2</sup> roller bottles at 1-20x10<sup>7</sup> cells per bottle and grown to confluence in DMEM medium containing 10% FCS and 2 mM L-glutamine. All cell lines were harvested utilising trypsin at 1x normal concentration. Following extensive washing in DMEM the cells were re-suspended at a concentration of 5-40x10<sup>6</sup> cells/ml and irradiated at 50-300 Gy using a Co<sup>60</sup> source. Following irradiation the cells were formulated in cryopreservation solution composing of 10% DMSO, 8% human serum albumin in phosphate buffered saline, and frozen at a cell concentration of 5-150 x 10<sup>6</sup> cells/ml, in liquid nitrogen until required for use.

### **Vaccination**

Prostate cancer patients were selected on the basis of being refractory to hormone therapy with a serum PSA level of at least 30 ng/ml. Ethical permission and MCA (UK Medicines Control Agency) authorization were sought and obtained to conduct this trial.

One of three vaccination schedules was followed for each arm of the trial:

Dose	Cell Lines Administered		
	Trial Arm A	Trial Arm B	Trial Arm C
1,2 and 3	PNT2	Du145	LnCap
4 and subsequent	PNT2 / Du145/ NIH1542	PNT2 / Du145/ LnCap	PNT2 / NIH1542/ LnCap

The cells were warmed gently in a water bath at 37 °C and admixed with mycobacterial adjuvant prior to injection into patients. Injections were made intradermally at four injection sites into draining lymph node basins. The minimum interval between doses was two weeks, and most of the doses were given at intervals of four weeks. Prior to the first dose, and prior to some subsequent doses, the patients were tested for delayed-type hypersensitivity (DTH) against the four cell lines listed in the vaccination schedule above (all tests involved 0.8 x 10<sup>6</sup> cells with no adjuvant).

### **Analysis of Immunological Response**

#### (a) T-Cell Proliferation Responses

To determine if vaccination resulted in a specific expansion of T-cell populations that recognised antigens derived from the vaccinating cell lines we performed a proliferation assay on T-cells following stimulation with lysates of the prostate cell

lines. Whole blood was extracted at each visit to the clinic and used in a BrdU (bromodeoxyuridine) based proliferation assay as described below:

#### *Patient BrdU proliferation method*

##### *Reagents*

RPMI		Life Technologies, Paisley Scotland.
BrdU		Sigma Chemical Co, Poole, Dorset.
PharMlyse	35221E	Pharmingen, Oxford UK
Cytofix/Cytoperm	2090KZ	"
Perm/Wash buffer (x10)	2091KZ	"
FITC Anti-BrdU/Dnase	340649	Becton Dickinson
PerCP Anti-CD3	347344	"
Pe Anti-CD4	30155X	Pharmingen
Pe Anti-CD8	30325X	"
FITC mu-IgG1	349041	Becton Dickinson
PerCP IgG1	349044	"
PE IgG1	340013	"

##### **Method**

- 1) Dilute 1 ml blood with 9 ml RPMI + 2mM L-gln +PS +50 $\mu$ M 2-Me. Do not add serum. Leave overnight at 37°C
- 2) On following morning, aliquot 450 $\mu$ l of diluted blood into wells of a 48-well plate and add 50 $\mu$ l of stimulator lysate. The lysate is made by freeze-thawing tumour cells (2x10<sup>6</sup> cell equivalents/ml) x3 in liquid nitrogen and then storing aliquots frozen until required.
- 3) Culture cells at 37°C for 5 days
- 4) On the evening of day 5 add 50 $\mu$ l BrdU @ 30 $\mu$ g/ml
- 5) Aliquot 100 $\mu$ l of each sample into a 96-well round-bottomed plate.
- 6) Spin plate and discard supernatant
- 7) Lyse red cells using 100 $\mu$ l *PharMlyse* for 5minutes at room temperature
- 8) Wash x2 with 50 $\mu$ l of Cytofix
- 9) Spin and remove supernatant by flicking
- 10) Permeabilise with 100 $\mu$ l Perm wash for 10mins at RT
- 11) Add 30 $\mu$ l of antibody mix comprising antibodies at correct dilution made up to volume with Perm-wash
- 12) Incubate for 30 mins in the dark at room temperature.
- 13) Wash x1 and resuspend in 100 $\mu$ l 2% paraformaldehyde
- 14) Add this to 400 $\mu$ l FACScan in cluster tubes ready for analysis
- 15) Analyse on FACScan, storing 3000 gated CD3 events.

Ln:	LnCap		
D:	Du145		
Pn:	PNT2		
Con:	ConA lectin (positive control)		
Nil:	No stimulation		

The results for the proliferation assays are shown in Figure 1 where a proliferation index for either CD4 or CD8 positive T-cells are plotted against the various cell lysates. The proliferation index being derived by dividing through the percentage of T-cells proliferating by the no-lysate control.

Results are shown for patient numbers 112, 307 and 406. Results are given for four cell lysates namely, NIH1542, LnCap, DU-145 and PNT-2. Overall, 50% of patients treated mount a specific proliferative response to at least one of the cell lines.

*(b) Western Blots Utilising Patients' Serum*

Standardised cell lysates were prepared for a number of prostate cell lines to enable similar quantities of protein to be loaded on a denaturing SDS PAGE gel for Western blot analysis. Each blot was loaded with molecular weight markers, and equal amounts of protein derived from cell lysates of NIH1542, LnCap, DU-145 and PNT-2. The blot was then probed with serum from patients derived from pre-vaccination and following 16 weeks vaccination (four to six doses).

*Method*

a) Sample Preparation (Prostate Tumor Lines)

- Wash cell pellets 3 times in PBS
- Re-suspend at  $1 \times 10^7$  cells/ml of lysis buffer
- Pass through 5 cycles of rapid freeze thaw lysis in liquid nitrogen/water bath
- Centrifuge at 1500 rpm for 5 min to remove cell debris
- Ultracentrifuge at 20,000 rpm for 30 min to remove membrane contaminants
- Aliquot at 200  $\mu$ l and stored at -80°C

b) Gel Electrophoresis

- Lysates mixed 1:1 with Laemmli sample buffer and boiled for 5 min
- 20  $\mu$ g samples loaded into 4-20% gradient gel wells
- Gels run in Bjerrum and Schafer-Nielson transfer buffer (with SDS) at 200 V for 35 min.

c) Western Transfer

- Gels, nitrocellulose membranes and blotting paper equilibrated in transfer buffer for 15 min
- Arrange gel-nitrocellulose sandwich on anode of semi-dry electrophoretic transfer cell: 2 sheets of blotting paper, nitrocellulose membrane, gel, 2 sheets of blotting paper
- Apply cathode and run at 25 V for 90 min.

## d) Immunological Detection of Proteins

- Block nitrocellulose membranes overnight at 4°C with 5% Marvel in PBS/0/05% Tween 20
- Rinse membranes twice in PBS/0.05% Tween 20, then wash for 20 min and 2 x 5 min at RT on a shaking platform
- Incubate membranes in 1:20 dilution of clarified patient plasma for 120 min at RT on a shaking platform
- Wash as above with an additional 5 min final wash
- Incubate membranes in 1:250 dilution of biotin anti-human IgG or IgM for 90 min at RT on a shaking platform
- Wash as above with an additional 5 min final wash
- Incubate membranes in 1:1000 dilution of streptavidin-horseradish peroxidase conjugate for 60 min at RT on a shaking platform
- Wash as above
- Incubate membranes in Diaminobenzidine peroxidase substrate for 5 min to allow colour development, stop reaction by rinsing membrane with water

The results in Figure 3 for patients 112, 305 and 402 clearly show that vaccination over the period of 16 weeks (four to six doses) can result in an increase in antibody titre against cell line lysates and also cross reactivity against lysates not received in this vaccination regime (other than DTH testing).

(c) Antibody Titre Determination

Antibody titres were determined by coating ELISA plates with standardised cell line lysates and performing dilution studies on serum from vaccinated patients.

*Method for ELISA with anti-lysate IgG.*

1. Coat plates with 50  $\mu$ l/well lysates (@10 $\mu$ g/ml) using the following dilutions:-

Lysate	Protein conc	Coating conc	amount/ml	amount in 5mls $\mu$ l
PNT2	2.5 mg/ml	10 $\mu$ g/ml	3.89 $\mu$ l	19.4 $\mu$ l
1542	4.8 mg/ml	10 $\mu$ g/ml	2.07 $\mu$ l	10.3 $\mu$ l
Du145	2.4 mg/ml	10 $\mu$ g/ml	4.17 $\mu$ l	20.8 $\mu$ l
LnCap	2.4 mg/ml	10 $\mu$ g/ml	4.12 $\mu$ l	20.6 $\mu$ l

2. Cover and incubate overnight @ 4°C
3. Wash x2 PBS-Tween. Pound plate on paper towels to dry.
4. Block with PBS/10%FCS (100 $\mu$ l/well)
5. Cover and incubate @ room temperature (RT) for 1hour (minimum).
6. Wash x2 PBS-Tween
7. Add 100 $\mu$ l PBS-10% FCS to rows 2-8
8. Add 200 $\mu$ l plasma sample (diluted 1 in 100 in PBS-10%FCS ie. 10 $\mu$ l plasma added to 990 $\mu$ l PBS- 10% FCS) to row 1 and do serial 100 $\mu$ l dilutions down the plate as below. Discard extra 100 $\mu$ l from bottom well. Cover and incubate in fridge overnight.
9. Dilute biotinylated antibody (Pharmingen; IgG 34162D) ie. final conc 1mg/ml (ie 20ml in 10mls).
10. Cover and incubate @RT for 45min.
11. Wash x 6 as above.
12. Dilute streptavidin -HRP (Pharmingen, 13047E 0; dilute 1:1000 (ie10ml ->10 mls).
13. Add 100ml/well.
14. Incubate 30 min @RT.
15. Wash x 8.
16. Add 100ml substrate / well. Allow to develop 10-80 min at RT.
17. Colour reaction stopped by adding 100ml 1M H<sub>2</sub>SO<sub>4</sub>.
18. Read OD @ A405nm.

The results in Figure 3 for patients 112, 305 and 402 show antibody titres at baseline (0), 4 weeks, 8 weeks and 16 weeks. The data show that after vaccination with at least four doses, patients can show an increase in antibody titre against cell line lysates and also cross-reactivity against cell lines not received in this vaccination regime (except as DTH doses).

*(d) Evaluation of PSA Levels*

PSA levels for patients receiving the vaccine were recorded at entry into the trial and throughout the course of vaccination, using routinely used clinical kits. The PSA values for patients 110, 303 and 404 are shown in Figure 4 (vertical axis is serum PSA in ng/ml; horizontal axis is time, with the first time point representing the initiation of the vaccination programme) and portray a drop or partial stabilisation of the PSA values, which in this group of patients normally continues to rise, often exponentially. The result for patient 110 is somewhat confounded by the radiotherapy treatment to alleviate bone pain, although the PSA level had dropped prior to radiotherapy.

**Example 2: Use of a Normal Melanocyte in a Murine Melanoma Protection Model Model**

A normal melanocyte cell line was used in a vaccination protection model of murine melanoma utilising the B16.F10 as the challenge dose. The C57 mice received two vaccinations of either PBS,  $5 \times 10^5$  irradiated K1735 allogeneic melanoma cells or  $5 \times 10^5$  irradiated Melan P1 autologous normal melanocyte cells on days -14 and -7. Challenge on day 0 was with  $1 \times 10^6$  B16.F10 cells and tumour volume measured every three days from day 10 onwards. Animals were sacrificed when the tumour had grown to 1.5x1.5 cm measured across the maximum dimensions of the tumour. Figure 5 shows that vaccination with Melan1P cells offer some level of protection against this particularly aggressive murine tumour.

1. An allogeneic immunotherapeutic agent for the treatment of prostate cancer comprising three human prostate cell lines from three different sources, of which one, two or three cell lines are derived from normal tissue(s), wherein each said normal tissue(s) is (are) from a source which is a non-cancerous prostate.
2. An immunotherapeutic agent for the treatment of prostate cancer according to claim 1, comprising three human prostate cell lines of which one cell line is derived from normal tissue and the other two cell lines are derived from tumour tissues.
3. An immunotherapeutic agent for the treatment of prostate cancer according to claim 1, comprising three human prostate cell lines of which two cell lines are derived from normal tissue and the other cell line is derived from a tumour tissue.
4. An immunotherapeutic agent of claims 1, 2 and 3 where the lines derived from normal tissue are chosen from PNT1A (ECACC Ref No: 95012614) or PNT2 (ECACC Ref No: 95012613)
5. An immunotherapeutic agent of claims 1, 2 and 3 where the line(s) derived from tumour tissue is/are chosen from NIH1519-CPTX, NIH1532-CP2TX, NIH1535-CP1TX, NIH1542-CP3TX, CA-HPV-10, LnCap, DU145 or PC3.
6. An immunotherapeutic agent for the treatment of prostate cancer comprising three cell lines, namely PNT2, NIH1542-CP3TX and DU145.
7. An immunotherapeutic agent for the treatment of prostate cancer comprising three cell lines, namely PNT2, NIH1542-CP3TX and LnCap.
8. An immunotherapeutic agent for the treatment of prostate cancer comprising three cell lines, namely PNT2, DU145 and LnCap.
9. An immunotherapeutic agent of claims 1-8 wherein the tumour cell lines have been irradiated at 50 to 300 Gy.
10. An immunotherapeutic agent of claims 1-8 wherein the tumour cell lines have been irradiated at 100 to 150 Gy.
11. An allogeneic immunogenic composition comprising an immunotherapeutic agent of claims 1-10 combined with a vaccine adjuvant selected from mycobacterial preparations such as BCG or M. Vaccae, Tetanus toxoid, Diphtheria toxoid, Bordetella Pertussis, interleukin 2, interleukin 12, interleukin 4, interleukin 7, Complete Freund's Adjuvant, Incomplete Freund's Adjuvant or other non-specific agents adjuvant.
12. An immunogenic composition comprising an immunotherapeutic agent of claims 1-10 combined with a vaccine adjuvant selected from mycobacterial preparations such as BCG or M. Vaccae.
13. An immunotherapeutic agent or composition of claims 1-12 wherein the cells are formulated with a cryoprotectant solution including but not limited to 10-30% v/v

**DECLARATION AND POWER OF ATTORNEY**

As a below named inventor, I HEREBY DECLARE:

THAT my residence, post office address, and citizenship are as stated below next to my name;

THAT I believe I am the original, first, and sole inventor (if only one inventor is named below) or an original, first, and joint inventor (if plural inventors are named below or in an attached Declaration) of the subject matter which is claimed and for which a patent is sought on the invention entitled

**USE OF HUMAN PROSTATE CELL LINES IN CANCER TREATMENT**

the specification of which (check one)

\_\_\_\_\_ is attached hereto.

X

was filed on December 9, 1999 as PCT International Application Number PCT/GB99/04129 and amended on November 16, 2000

THAT I do not know and do not believe that the same invention was ever known or used by others in the United States of America, or was patented or described in any printed publication in any country, before I (we) invented it;

THAT I do not know and do not believe that the same invention was patented or described in any printed publication in any country, or in public use or on sale in the United States of America, for more than one year prior to the filing date of this United States application;

THAT I do not know and do not believe that the same invention was first patented or made the subject of an inventor's certificate that issued in any country foreign to the United States of America before the filing date of this United States application if the foreign application was filed by me (us), or by my (our) legal representatives or assigns, more than twelve months (six months for design patents) prior to the filing date of this United States application;

THAT I have reviewed and understand the contents of the above-identified specification, including the claim(s), as amended by any amendment specifically referred to above;

THAT I believe that the above-identified specification contains a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the invention, and sets forth the best mode contemplated by me of carrying out the invention; and

THAT I acknowledge the duty to disclose to the U.S. Patent and Trademark Office all information known to me to be material to patentability as defined in Title 37, Code of Federal Regulations, § 1.56.

I HEREBY CLAIM foreign priority benefits under Title 35, United States Code § 119(a)-(d) or § 365(b) of any foreign application(s) for patent or inventor's certificate, or § 365(a) of any PCT international application which designated at least one country other than the United States of America, listed below and have also identified below any foreign application for patent or inventor's certificate or of

0357691.090501

any PCT international application having a filing date before that of the application on which priority is claimed.

Prior Foreign Application Number	Country	Foreign Filing Date	Priority Claimed?	Certified Copy Attached?
9827104.2	Great Britain	December 10, 1998	Yes	No

I HEREBY CLAIM the benefit under Title 35, United States Code § 119(e) of any United States provisional application(s) listed below.

U.S. Provisional Application Number	Filing Date

I HEREBY CLAIM the benefit under Title 35, United States Code, §120 of any United States application(s), or § 365(c) of any PCT international application designating the United States of America, listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States or PCT International application in the manner provided by the first paragraph of Title 35, United States Code, § 112, I acknowledge the duty to disclose information which is material to patentability as defined in Title 37, Code of Federal Regulations, § 1.56 which became available between the filing date of the prior application and the national or PCT international filing date of this application.

U.S. Parent Application Number	PCT Parent Application Number	Parent Filing Date	Parent Patent Number

I HEREBY APPOINT the following registered attorneys and agents of the law firm of **Heller Ehrman White & McAuliffe** to have full power to prosecute this application and any continuations, divisions, reissues, and reexaminations thereof, to receive the patent, and to transact all business in the United States Patent and Trademark Office connected therewith:
